COMMENTS TO AUTHORS

The manuscript entitled 'Endoscopic ultrasound-guided gallbladder drainage for acute cholecystitis: long-term outcomes after removal of a self-expandable metal stent' is more useful research. EUS-GBD with an SEMS is a possible alternative treatment for acute cholecystitis. Long-term outcomes after removal of the SEMS were excellent. Recurrence was seen in one patient. EUS sonographic images should be added.

COMMENTS TO AUTHORS

#1: Indication for EUS-GBD is uncertain. Is there any reason to select EUS-GBD for patient with cholecystitis? Metal stent is too expensive to be used temporarily for cholecystitis. Compared to EUS-GBD, PTGBD is equally effective for cholecystitis and its cost is lower than EUS-GBD using metal stent. #2: It is very interesting that gallstones disappeared after EUS-GBD. Gallstones are thought to move through the fistula between gallbladder and duodenum/stomach. However, diameter of gallstones must be less than those of metal stent. Authors should describe details. #3: Severity of acute cholecystitis is not shown. Most patients with mild cholecystitis are resolved by conservative treatment without gallbladder drainage. #4: One patient recurred cholecystitis even after gallstones disappeared. Why cholecystitis recurred?
