### COMMENTS TO AUTHORS

It is a retrospective study with a high interest topic, but the extent of the manuscript is not as long as would be expected from a research article. The section of discussion is not detailed enough. The authors didn't provide explanations for the main finding of the research, so the relevance of the results is unconvincing. The small number of citations also reduces the quality of the manuscript. The studied patients were divided into two groups according their births: in winter and non-winter months. In my opinion, investigating all four seasons could be more effective way for supporting the seasonal variation in adults undergoing total hip arthroplasty.
