Lymphoplasmacyte-Rich Meningioma With atypical cystic-solid feature: A case report and literature review

Kang-Chen Gu, Yang Wan, Li Xiang, Long-Sheng Wang, Wen-Jun Yao

Abstract

BACKGROUND

² Lymphoplasmacyte-rich meningioma (LPRM) is one of the rarest variants of meningioma and it is classified as grade I (benign) tumor, which is characterized by abundant infiltrates of lymphocytes and plasma cells. Here, we report an extremely rare case of LPRM with an atypical imaging finding of multiple cysts around a solid mass.

CASE SUMMARY

The patient was a 36-year-old man with intermittent headache, dizziness, and vomiting

2013-8-1 · Lymphoplasmacyte-rich meningioma is a very rare benign variant of intracranial meningioma, featured by massive inflammatory cell infiltration and often a less proportion of meningotheial tumorous elements. Surgical resection is still the primary treatment, and most of the patients have relatively favorable clinical outcomes.

Lymphoplasmacyte-rich meningiomas are rare histological variants of benign (WHO grade I) meningiomas, characterized by prominent lymphoplasmacytic infiltrates into the tumor, sometimes rendering the underlying meningotheial component inconspicuous.. They also have an unusual clinical course (for meningiomas) which instead mimics an inflammatory process 1.
