COMMENTS TO AUTHORS

This is a retrospective clinical analysis of 15 cases of solitary fibrous tumors in the abdomen and pelvis. SFTs in the abdomen and pelvis are rarely encountered in the clinics. Only anecdotal case reports could be seen in the journals. However, there had been several clinical review articles on SFTs originated in other sites in aspect of pathological or radiological findings. The title, abstract, material and methods, results, and discussions were well organized. However, several sentences in discussion need some corrections as below. P 9; Although rare, radiologists and surgeons must be aware of SFTs of in the abdomen and pelvis. -> aware of SFTs in the abdomen and pelvis Extrathoracic SFTs was typically demonstrated as a large, slow-growing soft tissue tumor. -> I think that SFTs are plural. P 10; General histological features that may help identify -> to identify In addition, malignant SFTs tend to lose CD34 immunoreactivity and over express Ki-67, p53 and S-100 [16]. ->P53
