SPECIFIC COMMENTS TO AUTHORS

This is a rare clinical case and it is worth introducing to all colleagues who are interested in cardiac lipomatosis. However, MRI images are not clear enough, especially about ILHIS. There is no identification of characteristic structures in the image, such as RV, LV, RF, LF, MV, TV, etc. Can a four-chamber view from MRI or TEE be given to clearly show the atrial septal lesion? And, although the mass could not be resected easily, a multidisciplinary approach to diagnosis and treatment should be adopted. Was there a cardiac surgeon involved in this treatment?
