**Early urological complications after kidney transplantation: An overview**

Jesmar Buttigieg, Andrei Agius-Anastasi , Ajay Sharma, Ahmed Halawa

**Abstract**

Urological complications, especially urine leaks, remain the commonest type of surgical complication in the early post-transplant period. Despite major advances in the field of transplantation, a small minority of kidney transplants are still being lost due to urological problems. Many of these complications can be traced back to the time of retrieval and implantation. Serial ultrasound examination of the transplanted graft in the early post-operative period is of key importance for early detection. The prognosis is generally excellent if recognised and managed in a timely fashion. The

跳到INTRODUCTION - The average age in the group of recipients who experienced urologic complications was similar (46.1 vs. 47.8) to those without complications. There was no vesicoureteral reflux or ureteral necrosis requiring surgical intervention, no graft loss and death related to urological complication and treatment.
