Non-polypoid colorectal neoplasms: Classification, therapy and follow-up

Antonio Facciorusso, Matteo Antonino, Marianna Di Majo, Michele Ravera, Nicola Masciarella

Abstract

In the last years, an increasing interest has been raised on non-polypoid colorectal tumors (NPT) and in particular on large flat neoplastic lesions beyond 10 mm leading to grow laterally, called laterally spreading tumors (LST). LSTs and large sessile polyps have a greater frequency of high-grade dysplasia (HGD) and local involvement as compared to polypoid lesions of the same size and usually represent a technical challenge for the endoscopist in terms of either diagnosis and resection. According to the Paris classification, NPTs are distinguished in slightly elevated (0-IIa, less than 2.5 mm), flat (0-IIc, 2.5-5 mm), and depressed (0-III, more than 5 mm).
