### **SPECIFIC COMMENTS TO AUTHORS**

This paper reports a case of esophageal submucosal hematoma secondary hemorrhagic shock caused by Mallory Weiss syndrome, which has certain reference significance for the prevention and treatment of this kind of rare disease. After reading the articles and consulting the materials, the following questions and suggestions are put forward: 1. please verify all data in the text, such as "blood pressure of 55/14 mmHg". 2. "Nothing abnormal was detected upon physical examination, including her skin." Is the sentence accurate? The patient has developed blood pressure and heart rate problems. 3. how long after that did the patient's hemodynamics become stable? The treatment method should be further described in detail, such as what hemostatic drugs are used? How to carry out anti shock treatment? 4. please provide pictures of scars at the esophageal ulcer on the 60th day after operation. 5. why only use PubMed search? Do you need to use other databases? 6. as a literature review, table 2 should also list the basic information and treatment of patients, such as age, sex, complications, imaging findings, prognosis time, etc. 7. "where we found 17 cases from January 1, 2014, through March 31, 2022 (Table 2)[2,5,7,9-17]". Whether the references cited here are correct, for example, 12. The object described here is diabetic rat. Please verify other references cited.

**SPECIFIC COMMENTS TO AUTHORS**

This manuscript presents the first case of submucosal esophageal hematoma-subsequent hemorrhagic shock due to Mallory-Weiss syndrome. I believe this paper is of great significance and deserves encouragement. My only advice is that the author should review and discuss similar cases in more detail.
