COMMENTS TO AUTHORS

In the present manuscript, the authors described 3 case patients with chronic HCV/AIH syndrome who were treated with DAA. DAA treatment promptly induced the normalization of liver biochemistries and the resolution of serological features of AIH. Although the present report is potentially easily understandable and very interesting, there are several issues that should be addressed as noted below. 1, In general, the treatment of corticosteroids can reduce liver injury in the patients with AIH. In case 2, budesonide did not reduce the ALT level in the patient. How about IgG level, ANA titer, F-actin antibody titer, and HCV RNA viral load after the treatment of budesonide? 2, In case 1, how about ANA after the treatment of DAA?

COMMENTS TO AUTHORS

I commend to the authors by proper report of three cases.
