Direct acting antiviral therapy is curative for chronic hepatitis C/autoimmune hepatitis overlap syndrome

Farhad Sahebjam, Cristina H Hajdu, Esther Norley, Samuel Sigal

Abstract

Autoimmune phenomena are common in patients with chronic hepatitis C. Management of chronic hepatitis C/autoimmune hepatitis syndrome has until recently been problematic due to the adverse effects of interferon on autoimmune processes and immunosuppression on viral replication. In this report we describe 3 patients with chronic hepatitis C/autoimmune hepatitis overlap syndrome who responded rapidly to direct acting anti-viral therapy. The resolution of the autoimmune process supports a direct viral role in its pathophysiology.

Key words: Hepatitis C, Autoimmune hepatitis, overlap syndrome, Direct acting antiviral therapy

Core tip: Autoimmune phenomena are common in patients with chronic hepatitis C, and occasionally patients with chronic hepatitis C have concomitant features of autoimmune
