## COMMENTS TO AUTHORS

This is a good study about endoscopic therapy for early gastric cancer (EGC). In this manuscript, the authors analyzed the relationship between lymph node metastasis and clinical pathology of EGC and provide a feasible endoscopic therapy. About 525 EGC patients who underwent surgical operations were analyzed. Clinical pathological features were compared between different EGC patients with or without lymph node metastasis. Multivariate analysis revealed that gender, tumor size, invasion depth, histological differentiation and lymphatic involvement were independent risk factors of lymph node metastasis. The study is well designed, and the results are interesting. Comments 1 The English of this manuscript need to be checked. There are some minor lanuguage polishing. 2 The results are interesting, if a figure is added, it will be more better. 3 Results are well dissused, and the references are updated.
