COMMENTS TO AUTHORS

Hepatitis C virus (HCV) is a disease which constitutes a small proportion of disease in the population of the world. However, getting to know new predictive factors in the treatment of this disease is important. The study is innovative in nature. The original study conducted on large groups of patients is very valuable. Below are a few minor comments to the reviewed publication. 1. In summary and discussion the authors did not provide acronyms GWAS 2. The name of the table 1 better to use instead of the word "subjects" for patients
