## SPECIFIC COMMENTS TO AUTHORS

I read this study with interest. This study explored the application effect of the narrative nursing method in postoperative lung cancer patients in the intensive care unit. Total 120 patients with lung cancer combined with cancer pain were included. The authors found that using narrative nursing methods to intervene in patients with lung cancer combined with cancerous pain can help patients to correctly recognize their disease, adjust their mentality, establish confidence, alleviate patients' subjective pain feelings, and improve their adverse emotions. Comments: 1. The author should edit the manuscript carefully. 2. Table 5 should be re-arranged. Some of the data are difficulty to read.
