Aspirin used as primary prophylaxis: Adverse outcomes in non-variceal upper gastrointestinal bleeding

 Karina M Souk, <sup>2</sup> Hani M Tamim, Hussein A Abu Daya, Don C Rockey, Kassem A Barada

## Abstract

 AIM: We compared outcomes of patients with non-variceal upper gastrointestinal bleeding <sup>2</sup> taking aspirin for primary prophylaxis to those not taking it.

METHODS: Patients not known to have any vascular disease (coronary artery or cerebrovascular disease) who were admitted to the American University of Beirut Medical Center between 1993 and 2010 with non-variceal upper gastrointestinal bleeding (NVUGIB) were included. The frequencies of in-hospital mortality, re-bleeding, severe bleeding, need for surgery or embolization, and of a composite outcome defined as the occurrence of any of the 4 bleeding-related adverse outcomes were compared between patients
