Cutaneous manifestations of hepatitis C in the era of new antiviral agents

Simone Garcovich, Matteo Garcovich, Rodolfo Capizzi, Antonio Gasbarrini, Maria Assunta Zocco

Abstract

The association of **chronic hepatitis C (HCV) infection** with a **wide spectrum of cutaneous manifestations** has been widely reported in the literature, with varying strength of epidemiological association. Skin diseases which are certainly related with chronic HCV infection due to a strong epidemiological and pathogenetic association are mixed cryoglobulinemia, lichen planus and porphyria cutanea tarda. Chronic pruritus and necrotic oral erythema are conditions that may share a possible association with HCV
