

Dear reviewers,

First of all, thanks for your comments which really important to me. About 6 CEUS predictive models for breast nodules, we made it based on the statistic analysis results of 10 enhanced patterns and our clinical practice experiences. Because we found that none of the enhanced patterns could reliably predict benign or malignant of breast nodules alone. So we tried to built them and did the retrospective study to check its efficacy. It showed that depending on these models, accuracy, sensitivity and specificity can all improved compared with every enhanced patterns. We think this is the first time that someone make these predictive models directly and we hope it can give some new ideas to other doctors interested in this area.

Thanks for your attention.

Dr. Luo jun
