COMMENTS TO AUTHORS

This is a case report describing successful treatment of a jejunal variceal bleeding due to superior mesenteric vein thrombosis secondary to an underlying hyper coagulable state with injection therapy performed during balloon enteroscopy. Since the patient has protein C deficiency as the underlying mechanism leading to the mesenteric thrombosis, the patient was treated with warfarin. The use of balloon enteroscopy for GI bleed of obscure origin is not novel, the use of injection therapy to treat variceal bleeding is not novel. The ability to use warfarin in the setting of a GI bleed that was treated therapeutically is not novel.
