### Abstract

Perivascular epithelioid cell tumour is not uncommon in the liver but seldom malignant.

### TO THE EDITOR

I read with great interest the work by Fang, Zhou, Jin and Hu, dealing with perivascular epithelioid cell tumour (angiomyolipoma) of the liver<sup>[1]</sup>. It is right that, in mesenchymal tissues, the tumour is common in the uterus. The most frequent localization generally is, however, in the kidney<sup>[2,3]</sup>. In the liver, 110 cases had been described by 1999<sup>[3]</sup>.

It is true that the malignant cases are much fewer.

Our interest in this entity was arisen, when we scrutinized a hepatic tumour, described from our department as an oncocytic adenoma<sup>[4]</sup>. However, the tumour later turned out to be positive for the melanocytic marker HMB-45 and is in fact a perivascular epithelioid cell tumour. The journal refused to publish the revised diagnosis!
