Abstract

A 28 year old male presented with simultaneous signs and symptoms of Erb's (C5) and Klumpke's (C8, T1) palsy, with sparing of the C6 and C7 roots. Initially, the patient also had shortness of breath, left diaphragmatic paralysis was shown clinically and radiographically to account for that. The etiology of the nerve dysfunction remained unknown. With persistent questioning and establishing the patient's trust in the caregivers, it was revealed that the patient had attempted suicidal hanging. We describe the clinical features and the likely mechanism of injury leading to this previously unreported combination of brachial plexus injuries.

Key words: Erb's palsy, Klumpke's palsy, hanging injury**Introduction**

Traumatic brachial plexus injuries are the most common type of brachial plexus injury⁶. Total lesioning of the brachial plexus occurs in 75% of traumatic brachial plexus injuries. Traumatic
