Variant of multiple sclerosis with dementia and tumefactive demyelinating brain lesions

Sherifa A Hamed

Abstract

We describe an unusual clinical and diagnostic feature of a patient with MS. **Case presentation:** A 25-years old woman was admitted to the Neurology department (December 2009) with one month history of rapid cognitive deterioration. She had poor cognition, dysphasia, reduction in visual acuity and temporal pallor of the optic discs. She had prolonged latencies of P100 component of visual evoked potentials (VEPs). MRI-brain showed multifocal large (≥ 3 cm) white-matter hypointense lesions in T1W and hyperintense in T2W and FLAIR images and patchy enhancement. A diagnosis of
