Perifollicular Granulomas with IgG4<sup>31</sup> Plasmacytosis: A Case Report and Review of Literature

Li Liang, Jain Zhou and Lei Chen

Abstract

Perifollicular granuloma is a unique histologic feature and whether it is associated with IgG4-related disease is controversial. We report a case of a 38-year-old man who presented with worsening left eye pain, proptosis, tearing, gritty sensation, blurred vision and multiple lymphadenopathy. An axillary lymph node resection showed reactive follicular and interfollicular lymph node hyperplasia, and increased eosinophils and plasma cells (at least 80% of immunoglobulin IgG+ plasma cells were positive for
