New skin closure system facilitates wound healing after cardiovascular implantable electronic device surgery

Elia De Maria

Abstract

The manuscript describes the efficacy of a new skin closure system (ZipLine™) for wound closure after pacemaker/ICD surgery. The system is particularly useful when wound healing is difficult with traditional methods and in patients at high risk for Surgical Site Infections (SSIs). This skin closure option is easy and quick to apply and remove, and produces excellent cosmetic results. Although it is associated with a minimal expense
