T-lymphoblastic lymphoma with cutaneous involvement

Emmanuelle Ginoux, Fanny Julia, Brigitte Balme, Luc Thomas, Stéphane Dalle

### Abstract

To study dermatological manifestation of T- lymphoblastic lymphoma and to help clinicians in the diagnosis. We report here the case of a 75-year-old patient who presented with violaceous nodules acquired during the last 4 weeks and affecting the scalp and right arm. The diagnosis of systemic lymphoma was suggested upon the appearance of cutaneous tumors, palpable lymph nodes and general symptoms including asthenia and weight-loss. The pathology features: positive immunostaining for CD3 and TdT (Terminal deoxynucleotidyl Transferase) and staging, led us to the final diagnosis of T-LBL with cutaneous involvement. He received a CHOP regimen
