2018年3月9日 - IBD is a life-long diagnosis, with possible detrimental outcome. Therefore, it is important to make a correct diagnosis and differential diagnosis early in the disease process in order to efficiently control downstream complications. Endoscopy plays a role in the diagnosis and management of IBD.

Role of endoscopy<sup>9</sup> in the surveillance and management of colorectal neoplasia in inflammatory bowel disease

Shaad Manchanda, Qurat-ul-ain Rizvi, Rajvinder Singh

### Abstract

Endoscopy has become increasingly fundamental in the management of patients with inflammatory bowel disease (IBD). It is required for diagnosis, assessment of therapeutic response, postoperative follow up and in the surveillance of dysplasia. With rapid advances in technology, including high definition colonoscopy and chromoendoscopy, questions have arisen regarding the most appropriate surveillance and management strategies of colorectal neoplasia in IBD. We aim to review current surveillance strategies, explore the utility of new technologies, and examine the role of endoscopic resection, with the aim of clarifying these questions.
