Amelanotic Esophageal Malignant Melanoma: Case Report and ...

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3037985>

Primary malignant melanoma of the esophagus (PMME) is a very rare tumor entity. Exact incidence rates are not available, since only small series and **case** reports have been reported so far. Patients suffering from PMME are usually diagnosed at a late stage, as the lesion's initial symptoms are nonspecific and challenging for any physician.

Primary malignant melanoma of the esophagus: A case report ...

Abstract

BACKGROUND

Primary malignant melanoma of the esophagus accounts for 0.1%-0.2% of all esophageal malignancies, including melanotic and amelanotic melanomas. Primary amelanotic malignant melanoma of the esophagus is extremely rare, and only about 20 cases have been published in the literature to date. Most primary malignant melanomas of the esophagus are diagnosed following development of a metastatic lesion and thus have a very poor prognosis. The median survival duration of patients with metastatic melanoma has been reported to be 6.2 mo.

CASE SUMMARY

A 49-year-old woman was referred to our hospital with the diagnosis of esophageal cancer. Endoscopy, biopsy, imaging evaluation and physical examination at our hospital indicated the diagnosis of advanced primary amelanotic malignant melanoma of the esophagus. Immunohistochemical staining confirmed melanoma. Nuclear medicine examination revealed a left iliac bone metastatic lesion. After discharge, the patient self-administered apatinib for 3 mo followed by oral treatment
