Delayed immune reconstitution after cord blood ...

www.bloodjournal.org/content/110/13/4543 ▾

Dec 15, 2007 · Abstract. Limited data exist using these methods to characterize **immune recovery** in adult **cord blood (CB) transplant** recipients, in whom infection is a leading cause of mortality. We now report the results of a single-center prospective study of T-cell **immune recovery after cord blood transplantation (CBT)** in a predominantly adult population.

Child with Wiskott-Aldrich syndrome underwent atypical immune reconstruction after umbilical cord blood transplantation: A case report

Li BH *et al.* Immune reconstruction after UCBT

Abstract

BACKGROUND

Timely reconstitution of a donor-derived immune system is important for recovery and long-term survival of patients after allogeneic hematopoietic stem cell transplantation (HSCT). We describe a case of Wiskott-Aldrich syndrome

<https://www.sciencedirect.com/science/article/pii/S107997961400028X>

We **report** a novel mutation in a boy **with** Wiskott–Aldrich **syndrome** (WAS) who was 4 years and 10 months of age and **underwent** successful **umbilical cord blood transplantation** (UCBT). The **child** presented at 3 months of age with symptomatic thrombocytopenia and eczema. Despite a large dose of intravenous immunoglobulin treatment, no increase in the platelet count was observed.
