Indications were history of VTE (4), hypercoagulable state (3), and profound immobility (25). Technical success rate of placement was 97.3% with one filter placed in the iliac vein using IVUS. Three patients (9.4%) were diagnosed with DVT postoperatively. Computed tomography detected PE in one of those patient (2.1%) two months postoperatively.

# Thoracoscopic segmentectomy assisted by three-dimensional computed tomography bronchography and angiography for lung cancer in a patient living with situs inversus totalis: A case report

Yun-Jiang Wu, Yang Bao, Ya-Li Wang

## Abstract

### BACKGROUND

<sup>1</sup> Situs inversus totalis (SIT) is a rare congenital condition which is characterized by a complete mirror image of the typical arrangement of the thoracic and abdominal viscera. Performing thoracoscopic segmentectomy for a patient with lung cancer and SIT is an extremely skilled and challenging surgical procedure.

### CASE SUMMARY

A 41-year old woman with a medical history of dextrocardia since childhood was admitted to our hospital with a mixed ground-glass opacity (mGGO) in her left lung field, discovered by computed tomography imaging during her health checkup. In order to facilitate surgical orientation, <sup>11</sup> three-dimensional computed tomography bronchography and angiography (3D-CTBA) were preoperatively

<https://medworm.com/journal/general-thoracic-and-cardiovascular-surgery.xml>

Preoperative evaluation of the pulmonary vessels and bronchus by three-dimensional computed tomography (CT) was unavailable owing to the patient's renal function disorder. However, the procedure was safely completed by adequate anatomic identification and careful operative manipulation based on plain CT study.
