RESULTS: The mean patient age was 59 years. The **choroidal melanoma** was a mean of 3.6 mm from the optic disc and 2.6 mm from the foveola. The mean **tumour basal dimension** was 11 mm and the mean tumour thickness was 4 mm. The **choroidal melanoma** showed intrinsic hypoautofluorescence (39%), **isoautofluorescence** (6%) and hyperautofluorescence (55%).

Distant metastasis in choroidal melanoma with spontaneous corneal perforation and intratumoral calcification: A case report

Tso-Wen Wang, Hung-Wei Liu, Youn-Shen Bee

Abstract

BACKGROUND

Uveal melanoma is the most common primary intraocular malignancy in adults, but the incidence is relatively low in Asian populations. Spontaneous corneal perforation and intratumoral calcification as presentations of choroidal melanoma are rare, and reports regarding these presentations have been limited. Even after complete surgical treatment, the prognosis of choroidal melanoma is usually poor if distant metastasis is present. We present a case of choroidal melanoma with unique presentations and early distant metastasis to the liver.

CASE SUMMARY

A 63-year-old Asian woman presented to our hospital with complaint of pain and brownish discharge from her left eye for 3 d. Image studies revealed intratumoral calcification within the left eye with eyeball rupture. Enucleation of the left eye was performed without incidence on the following day and
