Dec 15, 2018 · BACKGROUND. Mesenteric lymphangioma (ML) in adults is a very rare disease. We report six hospitalized adult patients with ML in our hospital between January 2013 and July 2018 to investigate the characteristics and prognosis of ML in adults.

Cavernous mesenteric lymphangiomatosis mimicking ...

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2731261>

Aug 21, 2009 · Typically, lymphangioma appears on computed tomography (CT) as a lower attenuation of a cystic mass, however, some cases appear to be a solid mass. We describe the CT and 18F-FDG positron emission tomography/CT appearance in a case of jejunal and mesenteric cavernous lymphangiomatosis mimicking metastasis in an adult patient with rectal cancer.

Jejunum cavernous lymphangioma manifested as gastrointestinal bleeding with hypogammaglobulinemia in adult: A case report and literature review

Bei Tan, Sheng-Yu Zhang, Yi-Nan Wang, Yuan Li, Xiao-Hua Shi, Jia-Ming Qian.

Abstract

BACKGROUND

Lymphangioma is a benign lesion that rarely involves the gastrointestinal tract, especially in adults. Small bowel lymphangioma is an extremely rare cause of gastrointestinal bleeding. Here we describe a case report of an adult diagnosed

Lymphangiomas are uncommon congenital malformations that present mainly in the head, neck, and axillar regions in pediatric patients. Mesenteric cystic lymphangiomas (MCLs), which occasionally present with substantial growth and the invasion of adjacent vital structures, are rarely reported in adults. We report a case of MCL in an **adult** who was treated with laparoscopic-assisted excision.
