**Positron emission tomography computed tomography findings of multiple cystic lymphangioma in an adult: A case report**

Mo-Mo Sun, Jie Shen

### Abstract

#### BACKGROUND

*Lymphangioma* is a rare benign cystic tumor believed to be a proliferation of heterotopic lymphocytes. It is caused by congenital lymphatic dysplasia or other acquired factors related to surgery, trauma, infection, or cancer. In this article, we present a case of an adult patient who underwent multi-modal

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5045258>

**Lymphangiomas** resulting from trauma have previously been reported in the upper limbs and head and neck region [ 3 – 5 ]. We present the fluorine-18 fluoro deoxyglucose ( 18 F-FDG) **positron emission tomography/computed tomography (PET/CT) findings of lymphangioma** in the iliac and inguinal areas of a 34-year-old male.

Aug 21, 2009 · Typically, **lymphangioma** appears on **computed tomography (CT)** as a lower attenuation of a **cystic mass**, however, some cases appear to be a solid mass. We describe the CT and <sup>18</sup>F-FDG **positron emission tomography/CT** appearance in a case of jejunal and mesenteric cavernous **lymphangiomatosis mimicking metastasis** in an adult patient with rectal cancer.
