Relevance on the diagnosis of malignant lymphoma of the salivary gland

Zhang XY *et al.* Malignant lymphoma/salivary gland

Xin-Yue Zhang, Zhi-Ming Wang

Abstract

Malignant lymphoma is a malignant tumor originating from the lymphohematopoietic system. It can occur in any lymphoid tissue. Malignant lymphoma of the salivary gland is rare, but its incidence has increased in recent years. Its clinical manifestations lack specificity, and it is often manifested as a painless mass in a salivary gland, which can be accompanied by multiple swollen cervical lymph nodes. Confirmation of the diagnosis before an invasive procedure is difficult. Clinically, malignant lymphoma of the salivary gland tends to be misdiagnosed, leading to an inappropriate treatment plan and the ultimate delay in the best treatment of the disease. This article reviews the pathogenesis, clinical features, imaging findings, diagnosis, treatment and prognosis of malignant lymphoma of the salivary gland.

It has been reported that primary tumors of the parotid gland show no characteristic features in diagnostic imaging, reflecting none of their histological findings (1). Therefore, it is difficult to differentiate benign conditions from malignant tumors and most patients are subjected to surgical procedures before a definitive diagnosis has been made. The head and neck region is the most common site where malignant lymphomas occur, but malignant lymphoma of the parotid gland is r...
