Two sequential surgeries in infant with multiple floor-of-mouth dermoid cysts: A case report

Liu NN *et al.* Multiple floor-of-mouth dermoid cysts

Nan-Nan Liu, Xin-Yue Zhang, Yan-Yan Tang, Zhi-Ming Wang

Abstract

BACKGROUND

Multiple intraoral dermoid cysts of large magnitude are a rarity in infants. They generally appear in the second or third decade of life, which are rare in infants and are usually solitary. In this case, a large mass was identified in utero during prenatal exams.

CASE SUMMARY

We introduce a rare case on multiple dermoid cysts in the floor of mouth of an infant who underwent two surgeries for this. Preoperative magnetic resonance imaging confirmed a large well-circumscribed cystic lesion that

[Case Report: Sublingual dermoid causing stertor in an infant](#)

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5030563>

Sublingual dermoids are uncommon lesions in the **floor of mouth**. The most common age of presentation is early adulthood, but presentation in **infancy** has also been reported. This report highlights the clinical presentation and treatment challenges in infants. An **8-month-old infant** presented with inability to close mouth, **intermittent stertor** and **snoring**.

<https://www.sciencedirect.com/science/article/pii/0030422075902182>

Dermoid cysts of the floor of the mouth comprise approximately 0.01 per cent of all **oral cystic lesions**. This case is presented because of its large size, its unusual **location**, and the difficulty encountered in removing the mass. R -oser, in 1859, first described **dermoid cysts** in the floor of the mouth as **epidermoid tumors**.
