We report a boy with who had undergone bone marrow transplantation (BMT) for idiopathic aplastic anemia who presented with features of limbic encephalitis presumed to be secondary to voltage-gated potassium channel (VGKC)-associated antibodies. This appears to be a novel instance of posttransplant autoimmune encephalitis. Patient Description

We herein present a case report of a liver graft infection by HSV-1 associated with liver failure and encephalitis. A complete hospital chart review of the case and a literature search were undertaken. Literature review suggests that herpes simplex acute liver failure is rare and associated with a poor prognosis, even with early treatment.

Encephalitis is the most prominent finding of HHV-6 infection in hematologic transplant recipients, but this entity seems to be rare after liver transplantation. Some reports describe neurological complications [36, 342]. However, HHV-6 is not a typical cause of encephalitis, but it has been reported in the

Japanese encephalitis

Japanese encephalitis is an infection of the brain caused by the **Japanese encephalitis virus**. While most infections result in little or no symptoms, occasional inflammation of the brain occurs. In these cases, symptoms may include headache, vomiting, fever, confusion and seizures. This occurs about 5 to 15 days after infection.
