

Undifferentiated embryonal sarcoma of the liver: Clinical characteristics and outcomes

Zhang C *et al.* Clinical characteristics and outcomes of UESL

Chong Zhang, Chang-Jun Jia, Can Xu, Qiu-Ju Sheng, Xiao-Guang Dou, Yang Ding

Abstract

BACKGROUND

Undifferentiated embryonal sarcoma of the liver (UESL) is a rare liver malignancy originating from primary mesenchymal tissue. The clinical manifestations, laboratory tests, and imaging examinations of the disease lack specificity and the preoperative misdiagnosis rate is high. The overall prognosis is poor and survival rate is low.

Undifferentiated Embryonal Sarcoma of the Liver: A Concise ...

<https://pubmed.ncbi.nlm.nih.gov/25611111>

Undifferentiated embryonal sarcoma of the liver is an **aggressive mesenchymal tumor that occurs predominantly in children**. Although this entity has been described for decades, its pathogenesis is still obscure. Its association with mesenchymal hamartoma has been well described on the basis of identical chromosomal abnormalities.

Undifferentiated (embryonal) sarcoma of the liver (USL) is a **rare malignant tumor** most commonly seen in children aged 6 to 10 years. Previously believed to carry a poor prognosis, more recent reports indicate that treatment regimens combining surgical resection and adjuvant chemotherapy can yield long-term, disease-free survival.
