Hemorrhagic fever with renal syndrome complicated with aortic dissection: A case report

Feng-Qi Qiu, Cong-Cong Li, Jian-Ya Zhou

Abstract

BACKGROUND

Hemorrhagic fever with renal syndrome is caused by hantaviruses presenting with high fever, hemorrhage, acute kidney injury. Microvascular injury and hemorrhage in mucus was often observed in patients with hantavirus infection. Infection with bacterial and virus related aortic aneurysm or dissection occurs sporadically. Here, we report a previously unreported case of hemorrhagic fever with concurrent aortic dissection.
