Camrelizumab (SHR-1210) leading to reactive capillary hemangioma in gingiva: A case report

Qing Yu, Wen-Xia Wang

Abstract

BACKGROUND

Oncologic immunotherapy is attracting attention as an effective strategy for cancer treatment. Currently, there are two kinds of inhibitors: Anti-PD-1 antibodies and anti-PD-L1 antibodies. These inhibitors have shown significant implications in improving the outcomes of certain cancer types in recent years. However, along with its effectiveness, adverse events cannot be ignored. As an anti-PD-1 antibody, camrelizumab (SHR-1210) has some side effects in tumor immunotherapy. The most common adverse event is reactive capillary hemangioma. While it is widely reported to occur in skin, gingiva reactive capillary hemangioma is rarely reported.
