Allograft artery mycotic aneurysm after kidney transplantation: A case report and review of literature

Bindi M *et al.* Kidney allograft artery MA

Marco Bindi, Mariano Ferraresso, Maria Letizia De Simeis, Nicholas Raison, Laura Clementoni, Serena Delbue, Marta Perego, Evaldo Favi

Abstract

BACKGROUND

Allograft artery mycotic aneurysm (MA) represents a rare but life-threatening complication of kidney transplantation (KTx). Graftectomy is widely considered the safest option. Due to the rarity of the disease and the substantial risk of fatal consequences, experience with conservative strategies is limited. To date, only a few reports on surgical repair have been published. We describe a case of true MA successfully managed by aneurysm resection and arterial re-anastomosis.

CASE SUMMARY

An 18-year-old gentleman, on post-operative day 70 after deceased donor KTx, presented
