Surgical therapy for hemangioma of the azygos vein arch under thoracoscopy: a case report

hemangioma of the azygos vein arch

Abstract

BACKGROUND

Azygos vein aneurysms are extremely rare, and their pathogenesis is not clear. The overwhelming majority of patients have no obvious clinical symptoms and are found to have the disease by physical examination or by chance. There are few reports about the diagnosis of and treatment strategy for this disease. Moreover, the choice of therapeutic schedule and the treatment window are controversial.

We use two universal staplers of **Endo GIA Ultra** to resect the vascular tumor. Thoracoscopic surgery revealed a mass arising from the azygos venous arch; there was light adhesion (Figure 2). A complete resection of 4.2 cm mass of the azygos venous arch was performed (Figure 3) and some thrombosis within the mass was observed (Figure 4). Pathological examination confirmed the diagnosis of a ...
