[Maxillary molar with dens evaginatus and multiple cusps ...](#)<https://www.ijohsjournal.org/article.asp?issn=2231...>

The most commonly reported accessory cusps are cusp of Carabelli of the molars, talons cusps of the incisors and Leong's tubercle of premolar. Herewith, we present a case of maxillary third molar associated with six supernumerary cusps along with a dens evaginatus that is a rarely reported dental variation in the literature.

Jan 01, 2006 · Dens evaginatus (DE) is an uncommon dental anomaly, having been well documented since 1925. It occurs primarily in people of Asian descent and is exhibited by protrusion of a tubercle from occlusal surfaces of posterior teeth, and lingual surfaces of anterior teeth.

**Separated root tip formation associated with a fractured tubercle of dens evaginatus:  
A case report**

Separated root tip formation

**Abstract**

**BACKGROUND**

Several previous studies have reported an unusual root formation in which a fractured apical fragment of immature root continued to develop independent of the main root after trauma to an immature tooth. To date, there have been only rare reports of the continuing apical formation of fractured root associated with dens evaginatus (DE). This paper presents a case of a separated root tip formation associated with a fractured tubercle of DE.
