Postoperative complications of concomitant fat embolism syndrome, pulmonary embolism and tympanic membrane perforation after tibiofibular fracture: A case report

Jin Shao, De-Ce Kong, Xin-Hui Zheng, Tian-Ning Chen, Tie-Yi Yang

Abstract

BACKGROUND

Fat embolism syndrome (FES) is a rare disease characterized by pulmonary distress, neurologic symptoms, and petechial rash and seriously threatens human life and health. It is still neglected clinically because of the lack of verifiable diagnostic criteria and atypical clinical symptoms. No studies on FES with pulmonary embolism (PE) and

Deletions within 22q11.2 are one of the most common microdeletions studied. We **report a case** of central 22q11.2 deletion with abnormal dentition, a feature not previously described in this condition. Although the diagnosis of central 22q11.2 deletion **syndrome** requires genetic testing, we aim to facilitate clinical recognition, expediting diagnosis.
