Collagenous nodule mixed simple cyst and hemangioma coexistence in the liver

Zhen-Jiang Zheng, Shu Zhang, Yang Cao, Guang-Chun Pu, Hong Liu

### Abstract

A 20-year-old female patient presented with two masses located in the left liver. In this patient, a CT scan revealed a hypodense mass and a second well-defined mass with a calcified nodule in the left hepatic lobe. No enhancements were apparent in or around the masses. A laparotomy was performed due to the patient's symptoms, namely the atypical CT findings and a risk of rupture of the subcapsular lesion. The operation revealed two masses in the left hepatic lobe and a left liver resection was
