Withdrawal of anti-tumour necrosis factor  $\alpha$  therapy in inflammatory bowel disease

Konstantinos Papamichail, Severine Vermeire

### Abstract

Anti-tumour necrosis factor alpha (anti-TNF $\alpha$ ) therapy is an established treatment in inflammatory bowel disease (IBD). However, this treatment is associated with high costs and the possibility of severe adverse events representing a true challenge for patients, clinicians and health care systems. Consequently, a crucial question is raised namely if therapy can be stopped once remission is achieved and if so, how and in whom. Additionally, in a real-life clinical setting, discontinuation may also be considered for other reasons

Prevalence of fatty liver disease and the economy in China: A systematic review
