Dysbiotic infection in the stomach

Hisashi Iizasa, Shyunji Ishihara, Timmy Richardo, Yuichi Kanehiro, Hironori Yoshiyama

Abstract

Microbiota in human alimentary tract plays important roles for homeostatic maintenance of the body. Compositional difference of gut microbiota is tightly associated with susceptibility of many diseases, including inflammatory diseases, obesity, diabetes mellitus, cancer, and atherosclerosis. "Dysbiosis" refers to a state of imbalance among the colonies of microorganisms within the body, which brings abnormal increase of specific minor components and decrease in the normally dominant species. Since stomach secretes strong acid for its digestive role, this organ has long been thought a sterile organ. However, the discovery of *Helicobacter pylori* (*H. pylori*) has changed the concept. This bacterium has proven to cause gastritis, peptic ulcer, and gastric cancer. However, recent cross-sectional studies
