Evidence-based medical oncology and interventional radiology paradigms for liver-dominant colorectal cancer metastases

Alan Alper Sag, Fatih Selcukbiricik, Nil Molinas Mandel

Abstract

Colorectal cancer metastasizes predictably, with liver predominance in most cases. Because liver involvement has been shown to be a major determinant of survival in this population, liver-directed therapies are increasingly considered even in cases where there is (limited) extrahepatic disease. Unfortunately, these patients carry a known risk of recurrence in the liver regardless of initial therapy choice. Therefore, there is a demand for minimally-invasive, non-surgical, personalized cancer treatments to preserve quality of life in the induction,
