Abstract

AIM

To evaluate and describe the efficacy of fecal microbiota transplantation (FMT) for *Clostridium difficile* infection (CDI) in a national Israeli cohort.

METHODS

All patients who received FMT for recurrent (recurrence within 8 wk of the previous treatment) or refractory CDI from 2013 through 2017 in all the five medical centers in Israel currently performing FMT were included. Stool donors were screened according to the Israeli Ministry of Health guidelines. Clinical and laboratory data of patients were collected from patients' medical files, and they included indications for FMT, risk
