Primary gastric non-Hodgkin lymphomas: Recent advances regarding disease pathogenesis and treatment

Optimal treatment for DLBCL PGL

Abstract

Primary gastric lymphomas (PGLs) are distinct lymphoproliferative neoplasms described as heterogeneous entities clinically and molecularly. Their main histological types are diffuse large B-cell lymphoma (DLBCL) or mucosa-associated lymphoma tissue (MALT). PGL has been one of the main fields of clinical research of our group in recent years. Although gastric DLBCLs are frequent, sufficient data to guide optimal care are scarce. Until today, a multidisciplinary approach has been applied, including chemotherapy, surgery and radiation, and a combination of these treatments. In this

Hodgkin Lymphoma: a review and update on recent progress

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5842098>

Hodgkin lymphoma is estimated to account for about 10% of cases of newly diagnosed lymphoma in the United States (8,260 of 80,500), the remainder being Non-Hodgkin lymphoma. Of 21,210 estimated deaths yearly due to lymphoma, about 1,070 (or 5%) are from Hodgkin lymphoma.
