Dysglycemia <sup>100</sup> after renal transplantation: definition, pathogenesis, outcomes and implications for management

David Langsford, Karen M Dwyer

## Abstract

New-onset diabetes after transplantation (NODAT) is major complication following renal transplantation. It commonly develops within 3-6 months post-transplantation. The development of NODAT is associated with significant increase in risk of major cardiovascular events and cardiovascular death. Other dysglycemic states, such as impaired glucose tolerance are also associated with increase risk of cardiovascular events. The pathogenesis of these dysglycemic states is complex. Older recipient age is a
