**Colonic pouch confers better bowel function and similar postoperative outcomes compared to straight anastomosis for low rectal cancer**

Colonic pouch in low rectal cancer

**Abstract****BACKGROUND**

With advancements in laparoscopic technology and the wide application of linear staplers, sphincter-saving procedures are increasingly performed for low rectal cancer. However, sphincter-saving procedures have led to the emergence of a unique clinical disorder termed anterior rectal resection syndrome. Colonic pouch anastomosis improves the quality of life of patients with rectal cancer >7 cm from the anal margin.

BACKGROUND: Patient-reported **outcomes** associated with different **bowel** reconstruction techniques following anterior resection for **rectal cancer** are still a matter of debate.. OBJECTIVE: This study aimed to assess quality of life and **bowel function** in patients who underwent **colonic J-pouch** or **straight** colorectal **anastomosis** reconstruction after **low** anterior resection.

Introduction: **Colonic** pouches have been used for 20 years to provide reservoir **function** after reconstructive proctectomy for **rectal cancer**. More recently coloplasty has been advocated as an alternative to a **colonic pouch**. However there have been no long-term randomized, controlled trials to compare functional **outcomes** of coloplasty, **colonic J-Pouch** (JP), or a **straight anastomosis** (SA) ...
