Total laparoscopic removal of accessory ²¹gallbladder: A case report and review of literature

Yaniv Cozacov, Gokulakrishna Subhas, Michael Jacobs, Janak Parikh

Abstract

²⁰Accessory ²gallbladder is a rare congenital anomaly occurring in ²1 in 4000 births, that is not associated with any specific symptoms. Usually this cannot be diagnosed on ²ultrasonography and hence they are usually not diagnosed preoperatively. Removal of the accessory gallbladder is necessary to avoid recurrence of symptoms. H-type accessory gallbladder is a rare anomaly. Once identified intra-operatively during laparoscopic cholecystectomy, the surgery is usually converted to open. By using the main gallbladder for liver traction and doing a dome down technique for the accessory gallbladder, we were able to perform the double cholecystectomy with intra-operative cholangiogram laparoscopically. Laparoscopic cholecystectomy was performed in 27-year-old male for biliary colic. Prior imaging with CT-scan and Ultrasound did not show a duplicated gallbladder. Intraoperatively after ligation of cystic artery and duct an additional structure was seen on its medial aspect. Intraoperative cholangiogram confirmed the patency of intra-hepatic and extra-hepatic biliary ducts. Subsequent
