Laparoscopic ventral mesh rectopexy for complete rectal prolapse: A retrospective study evaluating outcomes in north Indian population

Abhijit Chandra, Saket Kumar, Ajeet Pratap Maurya, Vishal Gupta, Vivek Gupta, Rahul

**Abstract**

**Background:** Multiple operative procedures have been described for management of rectal prolapse but the ideal technique still remains elusive. The objective of the study was to analyze the outcomes of laparoscopic ventral mesh rectopexy in the management of complete rectal prolapse in North Indian patients with inherent bulky and redundant colon.

**Methods:** The study was conducted at a tertiary health care center of North India. Between January 2010 and October 2014, 15 patients who underwent laparoscopic ventral mesh repair for complete rectal prolapse, were evaluated in the present study. Perioperative outcomes, improvement in bowel dysfunction or appearance of new complications were documented from the hospital records.
